A Visual Tour of R-1 Low Density Zoning in Eugene

With housing opportunity at an all time low, who is all this land supporting?
Over half of Eugenians are Renters. Over half of our residential land is R-1.

But who is the R-1 zone planning for?

The size of house addition possible for a single-family versus a two-family house makes it clear:

**Eugene's R-1 zone is discriminating against people, not buildings.**

The larger gray volume above shows the buildable volume for a single-family house on a fairly conventional lot size of 60 x 120 feet (0.165 acres). This volume is defined by a height limit of 37 feet (applicable for the roof pitch shown of 6:12 per 9.2751, 3d), standard building setbacks, and the max 50% lot coverage allowance (9.2750). The solar setback is assumed not to apply to this lot, which would be true for north-facing lots, and all east-west oriented lots. For reference, a typical three-bedroom house of 1600 square feet is shown inside. Clearly most of the houses built in Eugene are well below allowable size limits, and homeowners generally enjoy great liberty in expanding their homes (and developers would enjoy great liberty in rebuilding them). The smaller gray volume shows the buildable volume for an attached ADU (accessory dwelling unit). This volume is defined by a max 10% lot coverage and a sloping setback beginning at 8 feet up to a maximum of 18 feet.

Note also that this fairly conventional lot size allows less than 6 units per acre—less than half that technically allowed in R-1 (14 units/acre). That’s a lot of valuable real estate for each household. Especially when households increasingly have only 1 or 2 people these days. If minimum lot sizes were reduced to align with the 14 units/acre density limit of R-1, this lot could be subdivided, and two single-family homes could be built enabling greater homeownership opportunity.
The Co-op Revillaging Project
C Street Pilot Project

A collaboration of

[Logos for cultivate and one villages]
Site Plan

The development site enjoys a walkable location, just a few minutes from downtown Springfield. Due to the small-footprint homes ample greenspace remains available as well as four off-street parking spaces. Area for a future storage shed is planned which can include bicycle parking, household storage, and a garden shed. As a housing cooperative, the homes are owned and managed cooperatively. The land is held through a ground lease with the land trust, SquareOne Villages, who is available to provide administrative support to the co-op over time.
A New Pathway to Affordable Homeownership

With home prices now excluding the majority of Eugene-Springfield’s population from homeownership, transformative solutions to the housing crisis are called for. The Co-op Revillaging Project offers a housing development model creating new homeownership opportunities on typical residential lots, which remain permanently affordable. This is made possible through cooperation: intentionally-designed shared homes containing suites for multiple owners, and a shared ownership structure. The homes are owned through a limited-equity housing cooperative, and the land is secured by ownership through a community land trust. A one-time investment by local social investors paired with modest subsidies (~$24,000 per household) enable permanent affordability by households earning 60% of the area median income.

Through a spirit of cooperation, the Co-op Revillaging Project reestablishes a widely-accessible pathway toward homeownership and ensures these opportunities remain permanently available in the community. And unlike the suburban homeownership model of the 20th century, this model can serve a diversity of housing types and help facilitate a transition toward sustainable, socially-cohesive and walkable neighborhoods.

Floorplan | Shared House

4 Bedrooms, 4 Bathrooms, 1 Full Kitchen
Total Area 1650 SF

The house is designed to be shared by four co-op owners (with a maximum of five unrelated occupants per City regulation). Each bedroom area enjoys a bathroom and living space with a kitchenette, improving options for privacy among the shared household.

Construction | Net Zero Energy

With well-insulated 2x8 walls, airtight construction, and triple-paned windows, the homes aim to be "net zero energy ready", with future rooftop solar panels able to generate as much energy as the homes use in a year. This also means very low energy bills. Simple, optimized construction practices keep this affordable. Durability is also a priority: standing-seam metal roofing and fiber-cement siding are anticipated. These details are subject to change based on budgetary constraint.

**Roof**
- 14" wood I-Joist @ 24" o.c.
- Blown-In Insulation
- Air Barrier: Taped Sheathing

</table>

**NOTES**

Scenario 1: Both subsidy amount and low investor return present challenges, at least for this immediate development opportunity. Scenario 2: 80% AMI is close to market rate for a 1-bedroom rental unit. Presents marginal value to homeowners if equity is limited. Primary value is fixed rent.

That said, if the units can be sold initially, once the social investors are paid out, the monthly fee can be dropped to 60% AMI or below.

Scenario 3: Investor return is still quite low at Year 10. Better value to homeowner since equity can appreciate, but resale financing presents a challenge.

Scenario 4 & 5: Develop as rental property, use market appreciation to help achieve investor’s return (6% assumed; historically 9% per yr in Springfield over last 5 years).

Provides time for subsidies to be raised and since no longer new construction, Springfield downpayment assistance (SHOP) qualifies.

At Year 5, can achieve 60% AMI affordability with lower subsidy (2.5%/yr escalation assumed).

Can use excess cashflow to increase investor return or further lower homeowner payments, or contribute to Co-op Funding Pool.

Scenario 6: Back up plan: If for any reason co-op/land trust can’t purchase at Year 5, project can be held and sold later (i.e. Year 10) to achieve good return (takeout mortgage is assumed in this case).
